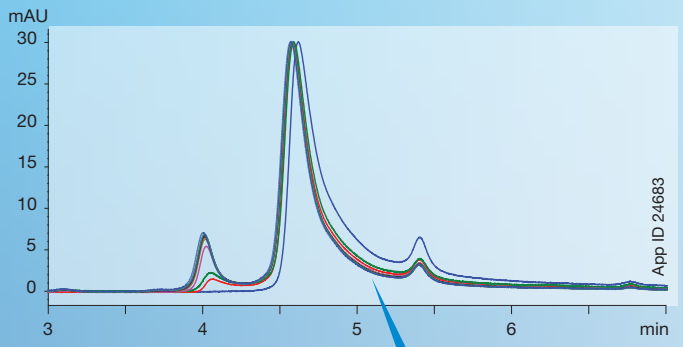
Extend Column Lifetime with Biocompatible Guard Cartridge Systems

The new biocompatible SecurityGuard™ Standard and ULTRA cartridge systems remove unwanted contaminants before they clog your column or system. Each bioZen™ column has a matching guard to ensure workflow applicability.
Learn more on page 22.

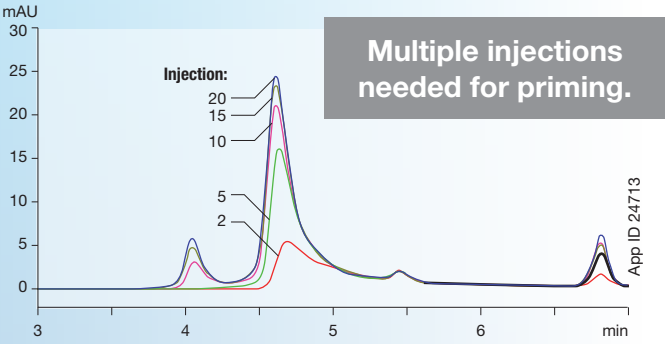
Proteins gave us a **piece of their MIND** and we **listened**. bioZen™ titanium BioTi™ HPLC/UHPLC hardware is designed to curtail unwanted secondary interactions, problematic carryover, and recovery issues between injection to detection.

Overlaid Successive Injections – Protein Priming Comparison

bioZen Titanium BioTi™ Hardware



Traditional Stainless Steel



Multiple injections needed for priming.

Conditions for both columns:

Column: bioZen 1.8 µm SEC-3
Dimension: 150 x 4.6 mm
Mobile Phase: 100 mM Sodium Phosphate Buffer (pH 6.8)
Flow Rate: 0.3 mL/min
Temperature: Ambient
Detection: UV @ 280 nm
Sample: 1. γ-Globulin
2. Ovalbumin

We engineered our new titanium BioTi biocompatible hardware to give you back the hours, days, and weeks typically spent on column priming.

Senior Scientist

MIND

7 Particle Chemistries and Growing

With a single innovative product line spanning major biologics workflows, you can now gain some reprieve from juggling multiple catalogs, bookmarks, and vendors. **Give your MIND a break** with high quality particle chemistries designed and tested for biologics.

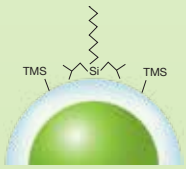
Two Particle Platforms

Thermally Modified Fully Porous

High Efficiency
Excellent Inertness
Increased Sensitivity
Exceptional Quality and Robustness

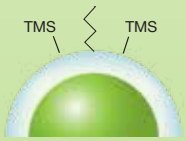
Core-Shell Technology

Intact



bioZen™ Intact XB-C8
3.6 µm

Large pore core-shell particle for fast intact biologic entry. C8 provides highly useful moderate hydrophobic selectivity.



bioZen Intact C4
3.6 µm

Large pore core-shell particle for fast intact biologic entry. C4 stationary phase provides highly sought after low hydrophobic retention, especially important for highly retentive biologics.

Size Exclusion (SEC)

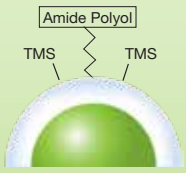
bioZen SEC-2
1.8 µm

Extremely inert, high density fully porous particle with high efficiency and low molecular weight (LMW) separation range of 1 K–450 kDa.

bioZen SEC-3
1.8 µm

Extremely inert, high density fully porous particle with high efficiency and high molecular weight (HMW) separation range of 10 K–700 kDa.

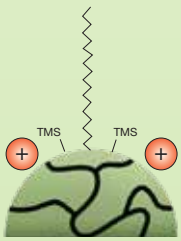
Glycan



bioZen Glycan
2.6 µm

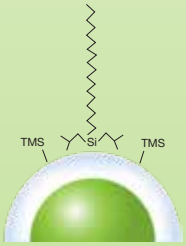
Provides optimal combination of high efficiency and selectivity for released glycans.

Peptide



bioZen Peptide PS-C18
1.6 µm and 3 µm

Excellent retention by combined positively charged surface ligand and C18 ligand.



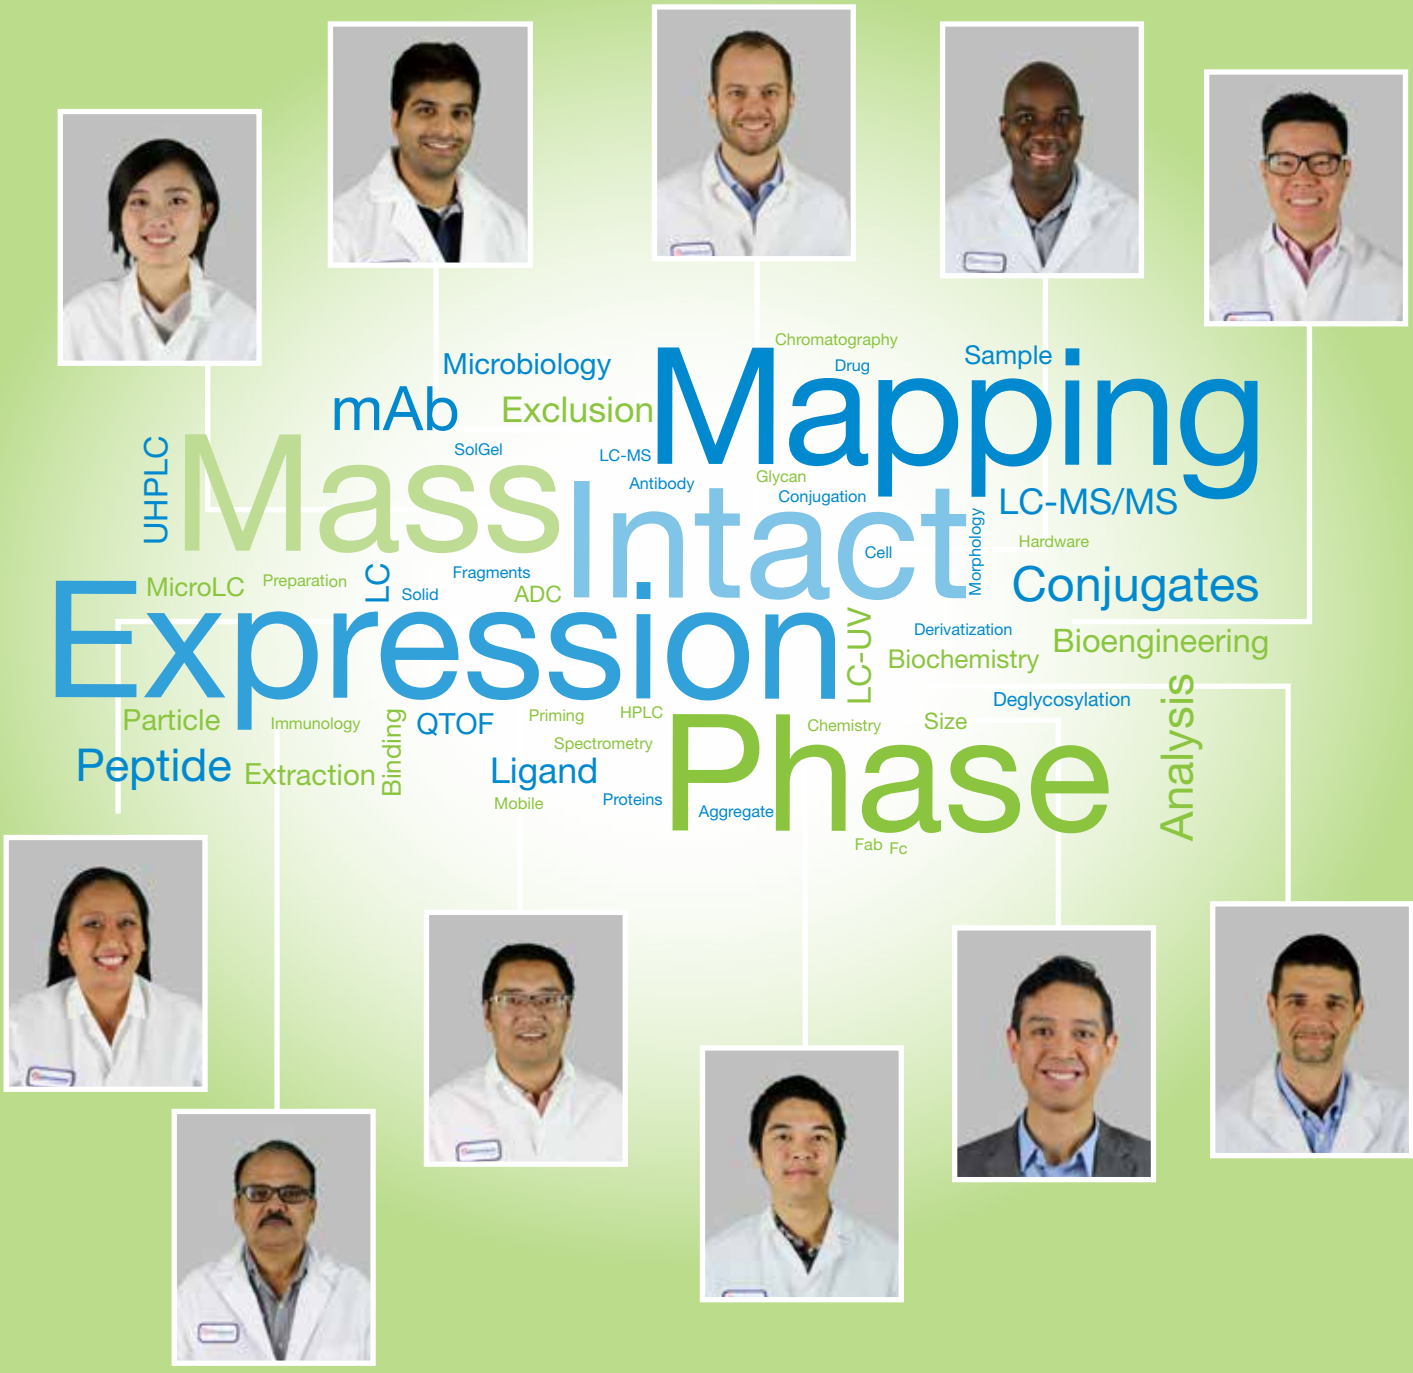
bioZen Peptide XB-C18
1.7 µm and 2.6 µm

Overall retention of both acidic and basic peptides through C18 stationary phase with di-isobutyl side chains.

We have 3 batches in stock of each material to ensure ease in method validation!

Protein Meets Separation

We decided to **keep in MIND** that biologics prefer it if Biochemists and Chromatographers combine forces. All jokes aside, **our talent is at your disposal** and we have an incredible array of experience in all areas of protein chemistry, conjugation, sample preparation, analysis, and detection.



BODY

Peptide Mapping

Digested mAbs or ADCs typically include a **large BODY of compounds** which are crucial to understanding post translation modifications. So we designed two bioZen Peptide columns to offer **highly useful and unique retention profiles**. Each allows for fast and effective elution windows by utilizing either high efficiency core-shell or thermally modified fully porous particles to gain sharper peaks, better peak capacities, and **overall higher sensitivity**.

bioZen™ the bio series

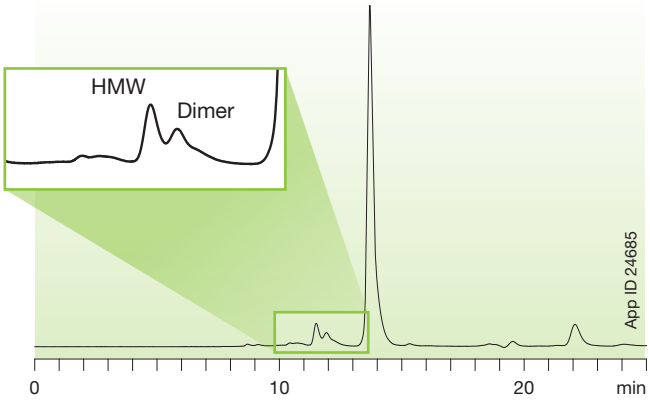
Detection: UV @ 214

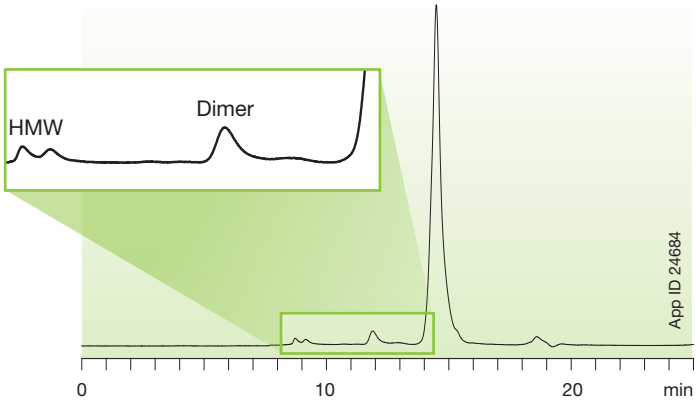
Aggregate Analysis

With **mAb aggregate often at very low levels** (<0.1 % by peak area compared to monomer) and fragment separation a requirement, adequate resolution and peak shape have become even more crucial method outcomes. To address this need, the robust set of bioZen™ SEC columns were developed with a **combination of UHPLC efficiency and higher sensitivity**, to drive resolution and identification of even lower level targets.

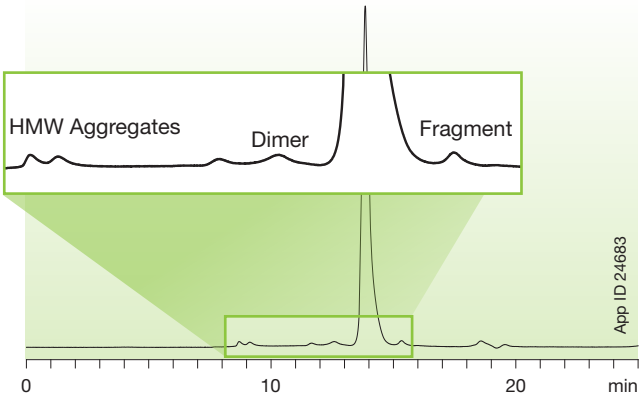
Adalimumab



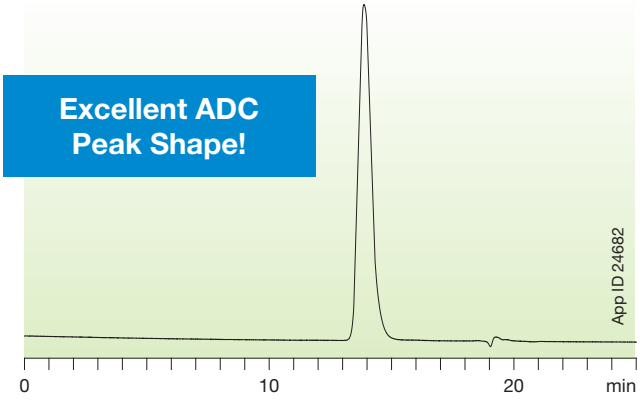
Trastuzumab



Rituximab



Herceptin - mcMMAF



Conditions same for all samples:

Column: bioZen 1.8 µm SEC-3
Dimension: 150 x 4.6 mm
Part No.: 00F-4772-E0
Mobile Phase: 50 mM Dipotassium phosphate + 100 mM NaCl (pH 6.8)
Flow Rate: 0.2 mL/min
Temperature: 25 °C
Detection: UV @ 280 nm
Sample: As Noted

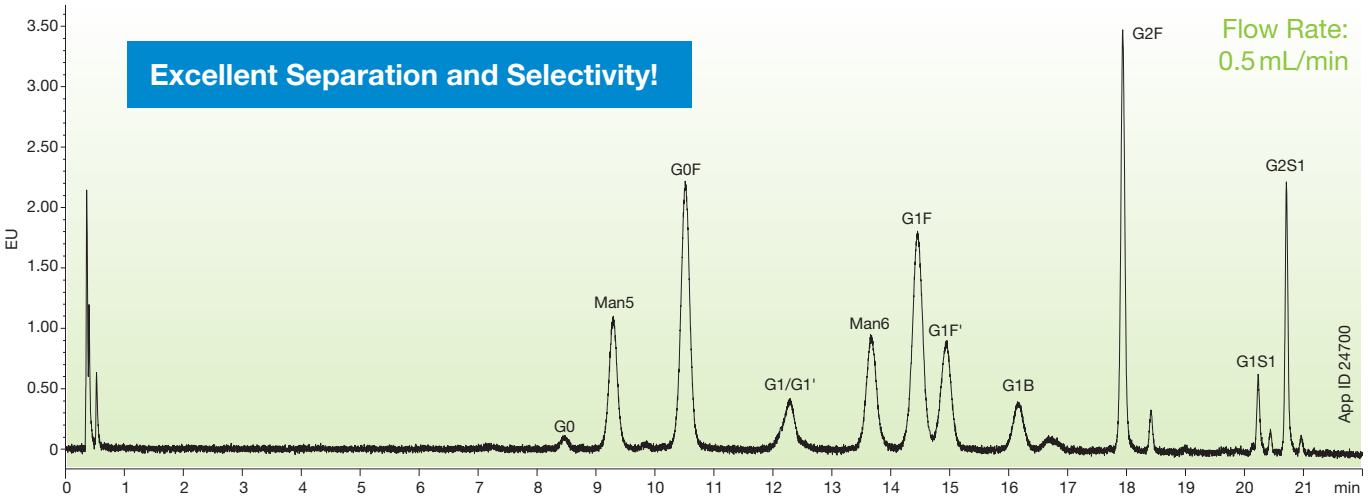
BODY

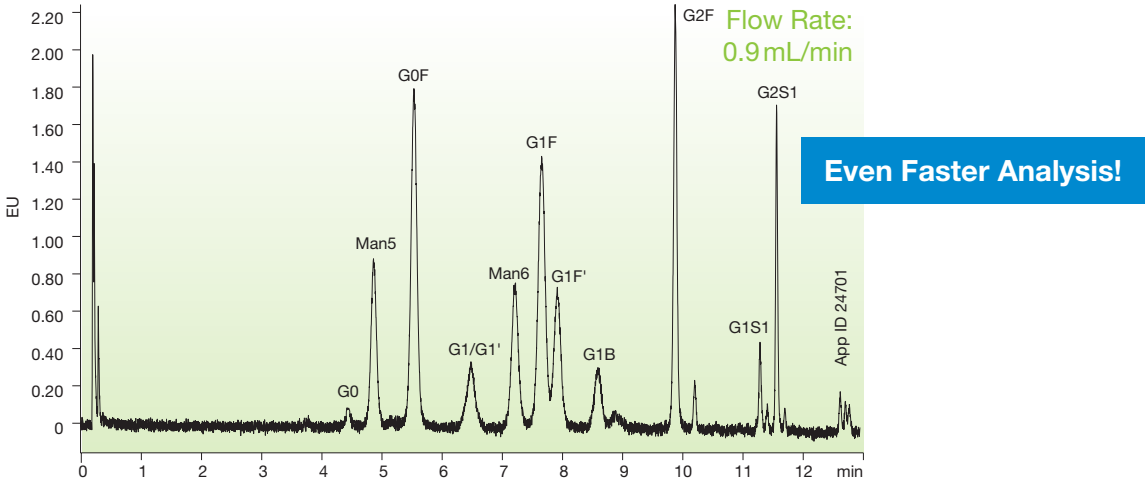
Glycan Analysis

The unique selectivity of the bioZen Glycan was designed to **provide higher order separations of released and labeled glycans**. With a 2.6 µm core-shell particle size, customers using either HPLC or UHPLC systems can draw upon a high efficiency bioZen Glycan particle run at higher linear velocities to easily provide sharper peak shapes and **faster elution windows,** without high UHPLC pressures. Under HILIC-FLR or HILIC-MS conditions, the bioZen Glycan excels with increased polar retention and selectivity.

bioZen™ the bio series

2-AB Labeled Glycans from Standard Solution





Conditions for both columns:

Column: bioZen 2.6 µm Glycan
Dimensions: 100 x 2.1 mm
Part No.: 00D-4773-AN
Mobile Phase: A: 100 mM Ammonium Formate, pH 4.5
B: Acetonitrile

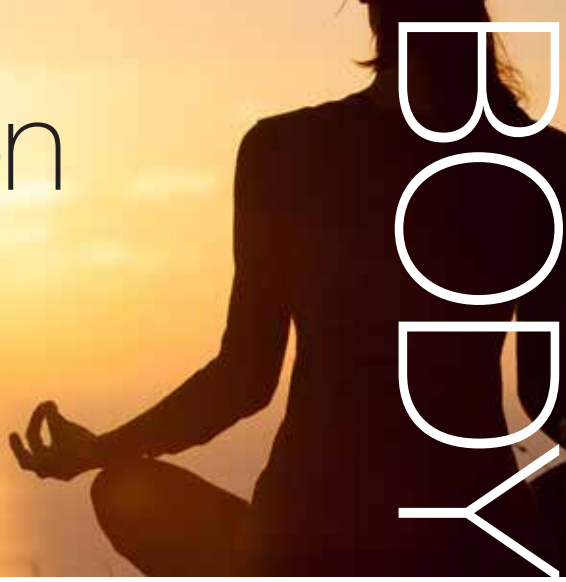
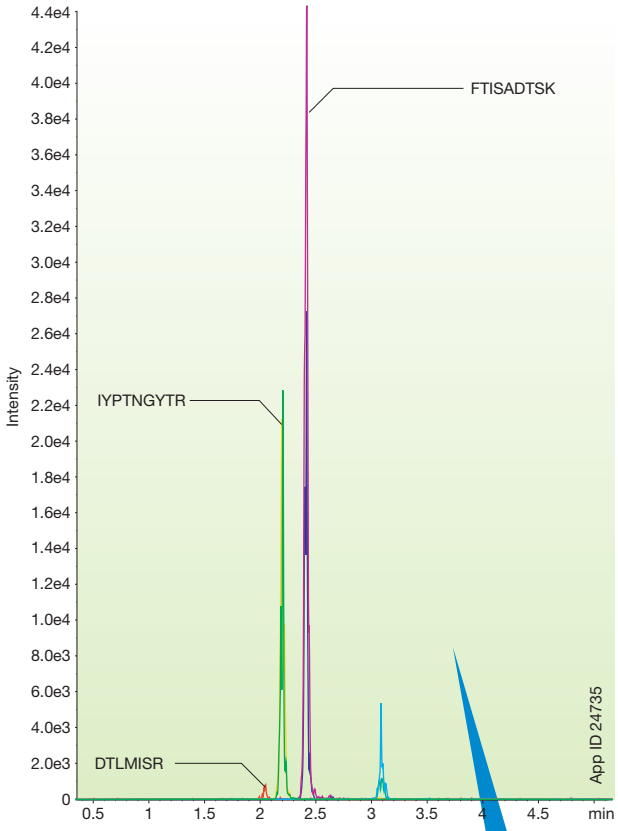
Temperature: 50 °C
Detection: FLD ex/em 330/420 nm
Sample: Human IgG Glycan Library

Peptide Quantitation

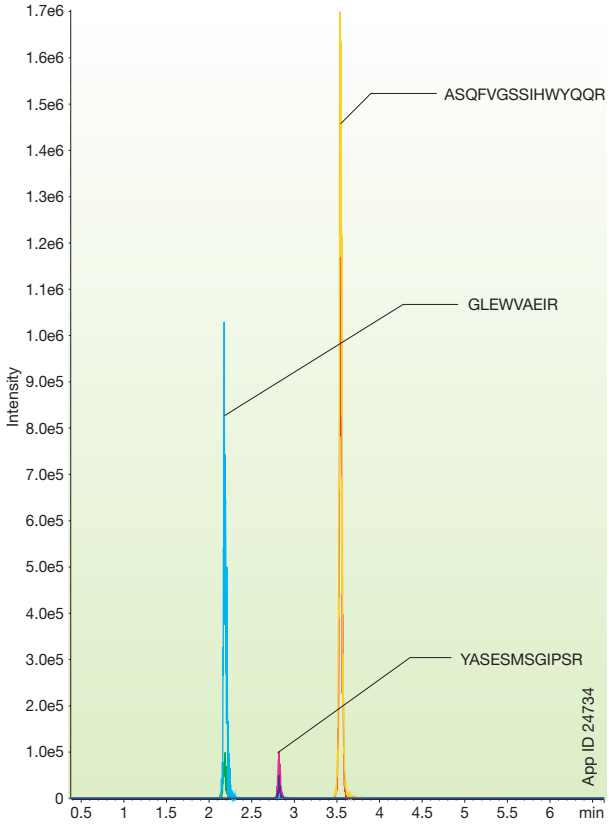


When quantitating signature peptides from biological matrices, you need sharp peak shape and sufficient retention of hydrophilic peptides to prevent any signal loss from matrix suppression regions. Both bioZen™ Peptide columns were developed to **deliver excellent selectivity for even closely related peptides**. Additionally, they build on this **BODY of valuable characteristics** with unique ways of delivering sharper peak shape for basic peptides; bioZen Peptide XB-C18 blocks secondary surface interactions via isobutyl side chains, while the bioZen Peptide PS-C18 contains a positively charged weak base that repels other basic species.

Kadcyla
(4 Signature Peptides)



Infliximab
(3 Signature Peptides)



Beautiful peak shape and height make quantitation with the PS-C18 a little like Lab Zen!

Conditions same for both samples:

Column: bioZen™ 3 µm Peptide PS-C18
Mobile Phase: A: 0.1% Formic Acid in Water
B: 0.1% Formic Acid in Acetonitrile

Gradient:	**Time (min)**	**% B**

	1	3
	4.5	25

Flow Rate: 0.5 mL/min
Temperature: 22 °C
LC System: ExionLC™ AD HPLC
Detection: MS/MS
Detector: SCIEX QTRAP® 5500
Sample: As noted above

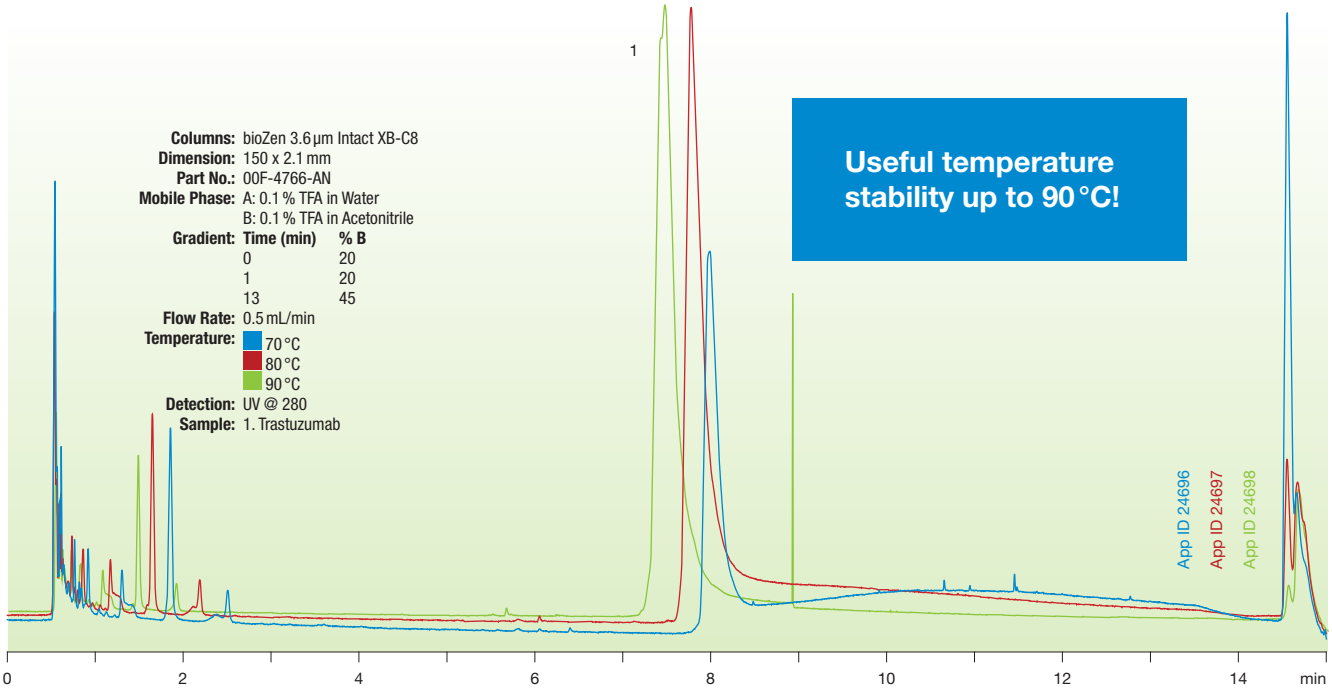
BODY

Intact & Fragment Analysis

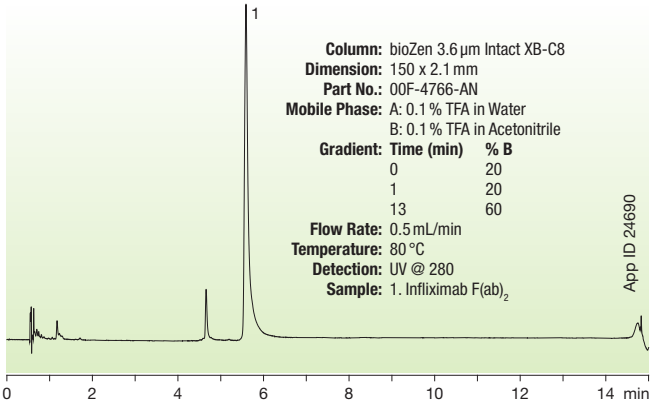
Impurity profiling and characterization of intact biologic fragments is a challenging undertaking because of the need to identify very small differences between variants. Both bioZen Intact columns contain skillfully manufactured large pore core-shell particles that **provide narrower, taller peaks** in conjunction **with higher resolution between the target HC/LC, Fc/Fab, or isoforms.**

bioZen™ the bio series

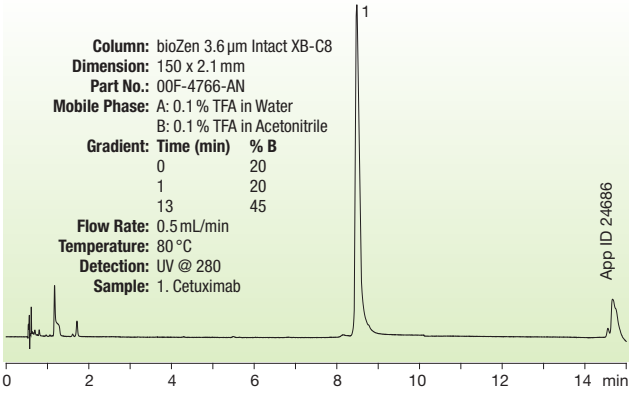
Intact Trastuzumab at 70, 80, and 90 °C



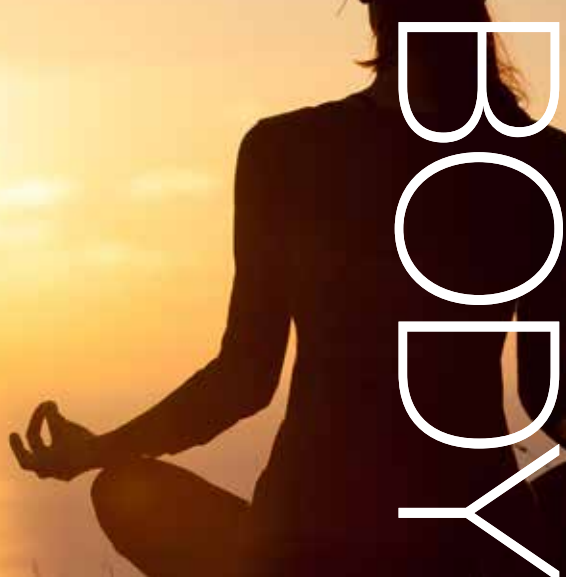
Infliximab F(ab)$_2$



Cetuximab



Intact Mass



Intact Mass can give indications not only of relative abundance of glycoforms, but also stability as degraded mAbs will not give good charge envelope by ESI-MS. Intact Mass with a high resolution MS to identify PTMs, especially relative abundance of glycoforms, **combines extremely well with the fast run times and tight peak shapes** provided by the bioZen™ Intact C4 and XB-C8.

BODY

Drug Antibody Ratio (DAR)

With a direct effect on efficacy and safety, **conjugation for each ADC must be well understood**. The bioZen Intact XB-C8 provides an excellent vehicle for determining drug load distribution and DAR for ADCs. Its large pore size allows intact ADCs to interact with a moderately retentive stationary phase while the core-shell particle supplies increased efficiency to **deliver the required resolution between ADC species with differing drug loads.**

Bio QC Testing

At every stage of our manufacturing and quality testing we keep you and your biologics analysis in mind. We initially focus on innovative products that will enhance workflows, then we work tirelessly to ensure that those products are reliably made time and time again. To further enrich the quality of these products, we assign very specific application-oriented testing protocols that properly mimic the conditions that you and other customers ultimately require.

Each batch of media and each column goes through a gambit of testing to ensure that you're getting our highest level of science, so that you can kick down the door of progress.

Batch-to-Batch Results—bioZen™ 1.8 µm SEC-3

Tips from our Protein Separation ZenMasters

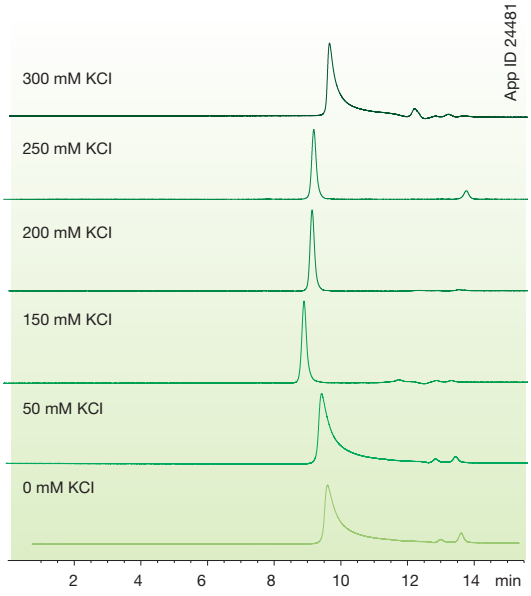
Size Exclusion and a Well Salted Buffer

Dani Xing
Technical Guru - Bioseparations

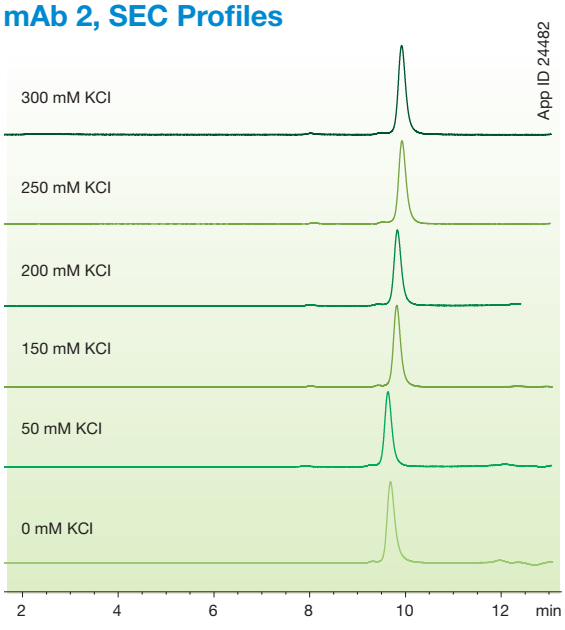
When developing a method for aggregate analysis of mAbs by SEC, it is critical to optimize mobile phase conditions to prevent non-specific secondary interactions. Below, you can see the effect of altering salt concentration in the mobile phase for two different biosimilar mAbs. The first mAb required a moderate amount of salt for acceptable peak shape. The second mAb performed well even with no salt. However, increases in salt showed incremental improvements in peak shape.

Ideally, buffer and salt concentration are optimized based upon the requirements for the method or analysis. However, when there is a need for a platform method, like when needed to evaluate several different mAbs, a good starting point for method development is 50 mM monopotassium phosphate, 250 mM potassium chloride, pH 6.8.

mAb 1, SEC Profiles



mAb 2, SEC Profiles



Conditions same for both samples, except where noted:

Column: bioZen 1.8 µm SEC-3

Mobile Phase: 50 mM KH_2PO_4, pH 6.8
KCl (as indicated)
Flow Rate: 0.3 mL/min
Detection: UV @ 280 nm
Temperature: Ambient

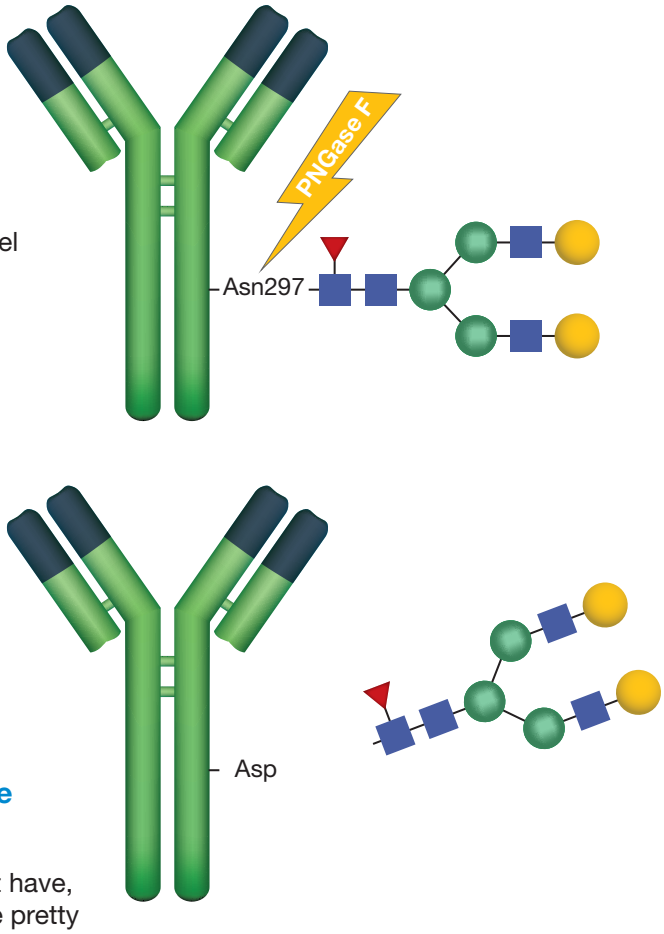
Deglycosylation Topics

How should I deglycosylate my antibody?

PNGase F is an endoglycosidase that cleaves N-glycans without bias, except for any that are core fucosylated α(1-3)—might I add if you're working with insects and plants, congrats, you're doing some rather interesting work in the world of glycobiology.

Most protocols for PNGase F were originally developed to deglycosylate complex glycoproteins; i.e. proteins with multiple glycosylation sites. For example, bovine fetuin, a common model glycoprotein, has 18 glycosylation sites.[1] As such, most protocols are developed using overnight deglycosylation to ensure deglycosylation to completion.

But if you need your answers tomorrow, what do you do? For a less complex glycoprotein like an IgG1 (2 glycosylation sites in the conserved region at Asn297), a shorter digestion time is acceptable. In fact, most vendors sell PNGase F formulated for faster deglycosylation, in some cases ten minutes or less. Furthermore, because the glycosylation sites are easily accessible, no denaturation is required.[2]



Why should I deglycosylate my ADC or antibody before intact mass?

Depending on how many different glycoforms the sample might have, a high degree of complexity in glycosylation could lead to some pretty messy spectra, which is especially difficult with ADCs.

As such, deglycosylation should be able to provide much nicer spectra, thus better assessment of relative quantitation of different DAR species, as well as average DAR.

One thing to always keep in mind—deglycosylation of the N-linked glycan yields an aspartic acid (Asp), resulting in a mass shift of 1 Da. Also to bear in mind—PNGase F reactions buffer is typically a Tris buffer, i.e. relatively high pH. Deamidation might be observed, commonly with the N-G motif; faster deglycosylation protocols might thus be desired.

LAB

Tips from our Protein Separation ZenMasters

Loading Capacity for SEC and RP

Chad Eichman, Ph.D.
BioPharm Global Marketing Manager

How do I determine the loading capacity of a SEC column?

For size exclusion, there are two considerations—sample volume and sample concentration.

As a general rule, load no more than 5 % of the column volume. Theoretically, a 300 x 4.6 mm column, with a column volume of ~5 mL, would limit injection volume to 200 µL. In practice, volumes of 10-30 µL are common.

Another important consideration is sample concentration; the higher the concentration of protein, the higher the viscosity of the sample, and this difference in viscosity can lead to peak shape distortion (either through exclusion effects or a solvent front referred to as “viscous fingering”). A good starting point is 1 mg/mL, though optimal concentrations must be determined experimentally.

What is the loading capacity of bioZen™ Intact and Peptide columns?

For bioZen Peptide columns, similar loads as other RP-LC columns can be used: 5-20 µg of digest or peptide mixture on a 4.6 mm ID column will give good sensitivity (especially for LC-MS) for peptide separations. Up to 50 µg can be loaded of a digest without increasing peak width too severely. For 2.1 mm ID columns, load should be scaled accordingly.

Because bioZen Intact columns have lower surface area, loading can drastically effect peak shape and must be determined experimentally for optimal results. For 4.6 mm ID’s, 5 µg is a good starting point. For 2.1 mm ID’s, 1 µg is a good starting point. Increasing in load may increase peak tailing and peak width significantly.

Organic Solvent and Size Exclusion

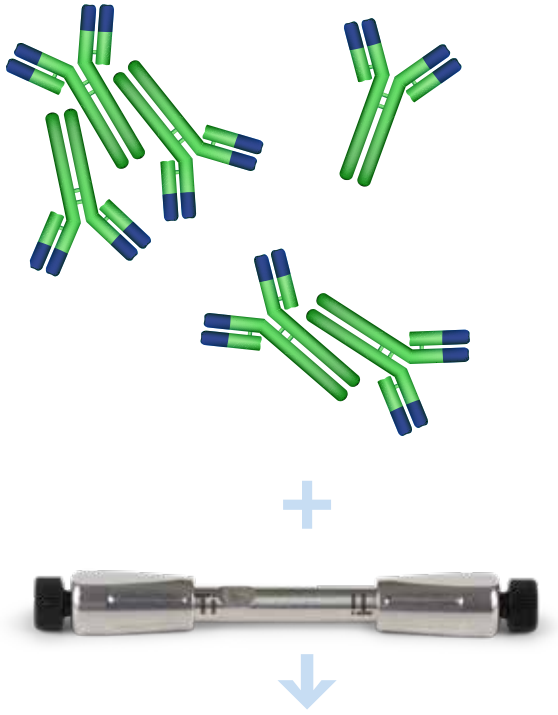
LAB

Organic Solvent and Size Exclusion

In order to get an “ideal” SEC separation (i.e. purely entropic separation, with no interaction of analyte with stationary phase), oftentimes some organic modifier, 5-15 % isopropanol or acetonitrile, might be necessary.

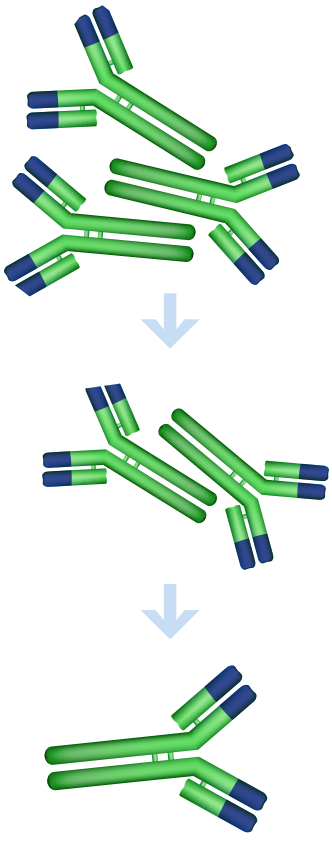
However, the question now is whether the protein is in a truly native state; one of the main contributors to aggregation are the hydrophobic interactions between monomers and fragments.

Most methods for ADCs use some organic, with 15 % IPA being the most common. This is widely accepted as appropriate for assessing aggregate, though results might need to be confirmed with an orthogonal sedimentation velocity analytical ultracentrifugation (SV-AUC).



How should a column be cleaned if it is typically used to analyze protein samples?

If strong ionic interactions between proteins and the stationary phase are suspected, then start cleaning with a denaturant such as 6 M guanidine hydrochloride or 10 % DMSO. If the protein is relatively hydrophobic, start by flushing out buffer with 95-100 % water, then clean out the hydrophobic proteins with a gradient from 95 % water/5 % acetonitrile up to 5 % water/95 % acetonitrile over 3-5 column volumes. During each step, be mindful that backpressures do not exceed the recommended limits; adjust flow rates as necessary.



Biocompatible Column/System Protection

The easiest way to extend column performance and minimize costly system and detector upkeep is to prevent contaminants and particulates from getting into and past your LC column with a guard system. SecurityGuard guard cartridge systems provide this protection and truly make it easy to acquire this benefit on both HPLC and UHPLC systems.

SecurityGuard ULTRA Guard Cartridge System with Titanium
